1. Construye el campo \mathbb{F}_{16} . También da sus tablas de suma y multiplicación.

SOLUCIÓN: En el anillo \mathbb{Z}_2 existe el polinomio irreducible $f(x) = x^4 + x + 1$. Tenemos que

$$\mathbb{F}_{16} = \mathbb{Z}_2[x]/(x^4 + x + 1) \quad (1)$$

donde los elementos de \mathbb{F}_{16} son:

$$\begin{aligned} \mathbb{F}_{16} &= \{ax^3 + bx^2 + cx + d : a, b, c, d \in \mathbb{Z}_2\} \\ &= \{0, 1, x, x+1, x^2, x^2+1, x^2+x, x^2+x+1, x^3, x^3+1, x^3+x, x^3+x+1, x^3+x^2, \\ &\quad x^3+x^2+x, x^3+x^2+1, x^3+x^2+x+1\} \end{aligned}$$

Etiquetamos cada uno de los elementos de \mathbb{F}_{16} de la siguiente manera:

$$\begin{array}{lll} \blacksquare g_0(x) = 0 & \blacksquare g_6(x) = x^2 + x & \blacksquare g_{12}(x) = x^3 + x^2 \\ \blacksquare g_1(x) = 1 & \blacksquare g_7(x) = x^2 + x + 1 & \blacksquare g_{13}(x) = x^3 + x^2 + x \\ \blacksquare g_2(x) = x & \blacksquare g_8(x) = x^3 & \blacksquare g_{14}(x) = x^3 + x^2 + 1 \\ \blacksquare g_3(x) = x + 1 & \blacksquare g_9(x) = x^3 + 1 & \blacksquare g_{15}(x) = x^3 + x^2 + x + 1 \\ \blacksquare g_4(x) = x^2 & \blacksquare g_{10}(x) = x^3 + x & \\ \blacksquare g_5(x) = x^2 + 1 & \blacksquare g_{11}(x) = x^3 + x + 1 & \end{array}$$

Su respectiva tabla de suma es:

2. Construye una matriz generadora para el código $RS(4, 11)$.

SOLUCIÓN: Una matriz generadora para $RS(4, 11)$ es

$$G = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 0 & 1 & 1 & 1 \end{pmatrix}$$

3. Supón que recibes la palabra $y = (10, 1, 2, 2, 2, 10, 7, 2, 9, 3, 7) \in \mathbb{F}_{11}^{11}$. Decodifica la palabra usando el algoritmo de Gao, sabiendo que la palabra es del código $RS(4, 11)$.
4. Construye una base para \mathcal{L}_k de tal manera que la matriz generadora del código $RS(k, q)$ sea de la forma

$$\begin{bmatrix} I_k & P \end{bmatrix} \quad (2)$$

donde I_k es la matriz identidad $k \times k$ y P es una matriz $k \times (q - k)$.

5. Demuestra que el número de subespacios vectoriales de \mathbb{F}_q^n de dimensión i es:

$$\mathcal{G}(n, i) = \frac{(q^n - 1)(q^n - q) \cdots (q^n - q^{i-1})}{(q^i - 1)(q^i - q) \cdots (q^i - q^{i-1})} \quad (3)$$

para $i = 1, \dots, n$.

6. Demuestra que $RS(k, q)_q^\top = RS(q - k, q)$.

Demostración.

7. Demuestra que si C es un código MDS , entonces C^\top también es MDS .

Demostración. Supongamos que C es un código MDS .

8. Resuelve los siguientes ejercicios

- a) Encuentra la matriz generadora G del código Simplex $S(3, 2)$.

SOLUCIÓN: Sabemos que el código $S(3, 2)$ tiene

$$\begin{aligned}\frac{q^k - 1}{q - 1} &= \frac{2^3 - 1}{2 - 1} \\ &= \frac{8 - 1}{1} \\ &= 7\end{aligned}$$

subespacios de dimensión 1. Por lo tanto,

$$G = \begin{pmatrix} 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 \end{pmatrix}$$

- b) Supongamos que un mensaje es enviado bajo el código $H(3, 2)$. Verifica si el mensaje $r = 1010001$ es correcto.

SOLUCIÓN: Sabemos que $H(3, 2) = [7, 4, 3]_2$ y que una matriz de verificación para $H(3, 2)$ es cualquier matriz generadora para $S(3, 2)$. Así, la matriz obtenida en el inciso anterior es una matriz de verificación para nuestro código $H(3, 2)$.

El mensaje r se puede ver como un vector

$$x = (1, 0, 1, 0, 0, 0, 1) \in \mathbb{F}_2^7$$

Ahora, calculamos el síndrome de x .

$$\begin{aligned}S(y) &= G \cdot x^t \\ &= \begin{pmatrix} 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 1 \end{pmatrix} \\ &= \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}\end{aligned}$$

Como $S(y) = (0, 1, 0)^t \neq 0$ entonces podemos concluir que hubo errores de transmisión. Notemos que $(0, 1, 0)^t$ corresponde a la segunda columna de G , por lo que sabemos que la segunda coordenada es incorrecta. Por lo tanto, la palabra enviada fue

$$r' = (1, 1, 1, 0, 0, 0, 1)$$
